

Data Integration & Data Quality

Make Every Data Point Increase Well Profitability.

In the oilfield, speed and accuracy are everything. Manual data entry and disconnected systems slow operations and drive up costs. To drill, frac, and produce faster, field data must flow seamlessly and reliably—no errors, no delays.

EZOps automatically pulls field data into a mobile-first platform for instant analysis and reporting—eliminating manual entry, reducing errors, and increasing data frequency. It also integrates with back office systems for full visibility and true data-driven operations.

Seamless API-based integrations:

Tie into SCADA, accounting software, pipeline mapping, emissions, and more. Our API-first approach ensures fast, reliable connections to the systems your operations rely on.

Set data range parameters alerts:

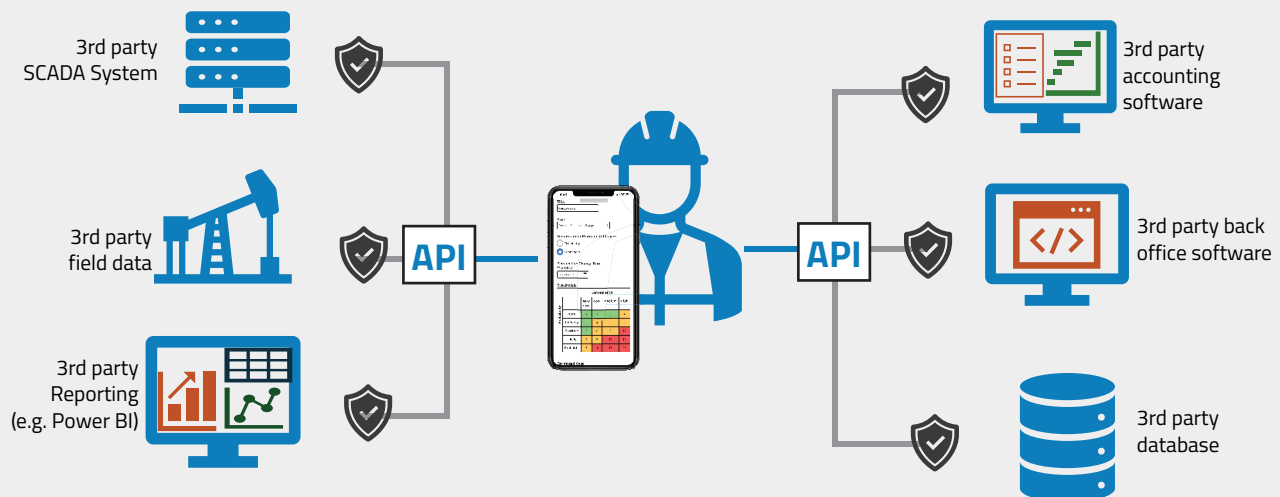

Set upper and lower data range limits to alert you when your data is out of range, enabling you to immediately correct or investigate, ensuring data quality

Keep the back office and field in sync:

Once connected, field updates, inspections, and production data flow effortlessly into back office systems. Everyone gets the same clear picture in real time.

Retain full data ownership with secure visibility: Your data stays your data.

Real-time data flow, even offline in the field | Secure storage and compliance protocols | Ownership clarity; you control who sees what

100%

Elimination of manual
data entry errors

80%

Reduction in
reconciliation time

68%
